

2nd Annual ASCOPE Laboratory Test Correlation Programme on CFR Engine (1981)

By:

Bustami Mustafa and E. Jasfi.

1. INTRODUCTION

The ASCOPE Work Programme for 1981 directed the Technical Committee to conduct the 2nd Annual Laboratory Test Correlation Programme for CFR Engines among petroleum laboratories in the ASCOPE member countries. Member countries taking part in this correlation programme are Indonesia with seven laboratories participating, Malaysia with two laboratories, Thailand and the Philippines with two laboratories each.

LEMIGAS Laboratory of Indonesia, as coordinator in this correlation programme, provided the samples to be sent to each participating laboratory. After being tested by the participating laboratories, the test results on these samples were to be sent to PPTMGB "LEMIGAS" in Jakarta for processing, including the determination of the standard deviation. Based on these results, conclusions can be drawn about the deviations of laboratory test results and about outliers to be rejected.

For proper analysis, the samples for correlation also require physical and chemical test such as specific gravity, RVP, distillation, and TEL content, in the receiving laboratories to take into account any possible changes in the sample properties which have occurred during transportation and storage.

Also important to be observed are ambient and engine operating conditions during the correlation tests.

The results of this analysis can then be used as a base for diagnosis of the probable causes of deviations, the occurrence of outliers and for recommendations of remedial steps to be taken.

The method used for testing the samples is the Bracketing Procedure System, while for rounding the values of the numbers found during the tests the ASA rules for rounding are used.

The Grubb's rejection criteria with the use of "T" factors are used in evaluating the possible outliers.

This article was first presented during a technical meeting on Laboratory Correlation, Oil Process and Application, held in Jakarta, from 9 up to 11 February 1982.

2. CORRELATION PROGRAMME EXECUTION

2.1 Sample Coding

LEMIGAS as coordinator, provided and prepared the correlation samples as shown in Table 1. The correlation samples were sent to each participating laboratory.

The amount of the correlation sample was two liters for each grade, put into two one-litre cans. One litre cans were used in order to comply with IATA air transport regulations concerning the maximum fuel container volumes permitted for air transport of inflammable materials.

To facilitate and simplify the conduct of this programme, each sample was coded alpha-numerically according to sample type as follows:

- SC number, where SC indicates sample code and number indicates sample type.

2.2 Participating Laboratories

The participating laboratories were similarly coded alpha-numerically as follows :

LC number, where LC indicates laboratory code and number indicates the participants number in this correlation programme.

The list of participating laboratories appears in Table 2 (p.12).

In order to facilitate communication, laboratories in each country were coordinated through a country coordinator. The list of Country Coordinators and Programme Coordinator appears in Table 3 (p.13).

3. SAMPLE PREPARATION

The sample preparation consisted of five steps, viz.:

- (1) acquisition of substances for sample preparation, materials and equipment
- (2) blending of sample
- (3) filling of sample into containers
- (4) packing
- (5) dispatch

Each of these steps was carried out in the routine manner, but with utmost care, by the coordinating laboratory (LEMIGAS)

4. ROUNDING RULES FOR TEST RESULTS

The ASA rules for rounding as they pertain to this procedure can be stated simply as follows:

- (1) The value of the number is unchanged when the last digit to be dropped is less than 5.
- (2) The digit preceding the digit to be dropped is raised by one when the last digit is greater than 5.
- (3) When the digit to be dropped is exactly 5 and the digit preceding it is an even digit, the 5 is dropped without change to the number.
- (4) When the digit to be dropped is exactly 5 and the digit preceding it is an odd digit, the digit preceding is raised by one.

Example:

5.1.1 Rounding off numbers to three digits to the right of the decimal point

5.1.1.1 Rounding off numbers to three digits to the right of the decimal point

	Number	Rounded	
		Nearest Hundredth	Nearest Tenth
1.	97.642	97.65	97.6
2.	97.237	97.24	97.2
3.	97.365	97.36	97.4
4.	97.985	97.98	98.0
5.	97.995	98.00	98.0

When rounding from three digits to one digit the last two digits to be dropped must be considered together and the rule applies to values greater or less than 50.

97.499	97.4
97.540	97.4
97.551	97.5
97.549	97.5
97.550	97.6

In the computation of Standard Deviation the use of $(n-1)$ is statistically more correct than n .

5. PROCEDURE FOR TEST DATA ANALYSIS

Test results are analysed according to the following procedure for calculating basic statistical data for analysis of check programme results.

The data obtained by this procedure include: sample average, average deviation and standard deviation, which are basic to other statistical treatment such as trend, etc.

The data thus obtained also provide sufficient parameters for comparing like data from individual or groups of laboratories performing the same tests. The procedure is presented in a step-by-step number to standardize the procedure and to simplify the calculations and evaluation.

The following steps are taken to calculate the basic statistical data:

. Step I

Number of results = n

Results

$X_1, X_2, X_3, \dots, X_n$

$$\text{Sum of results} = \sum_{i=1}^n X_i$$

$$\text{Average of results} = \frac{\sum_{i=1}^n X_i}{n} = \bar{X}$$

. Step III

Deviation = $X_1 - \bar{X}$

$$\text{Sum of deviation} = \sum_{i=1}^n (X_i - \bar{X})$$

$$\text{Average deviation} = \frac{\sum_{i=1}^n (X_i - \bar{X})^2}{n}$$

. Step IV

Deviation squared = $(X_1 - \bar{X})^2$

$$\text{Sum of deviation squared} = \sum_{i=1}^n (X_i - \bar{X})^2$$

. Step V

$$\text{Variance} = \frac{\sum_{i=1}^n (X_i - \bar{X})^2}{n-1}$$

. Step VI

$$\text{Standard deviation} = \sqrt{\text{variance}} = \sqrt{\frac{\sum_{i=1}^n (X_i - \bar{X})^2}{n-1}}$$

. Step VII

Rejection of outliers

$$\text{"T" factor} \times \text{standard deviation} = T \times \sqrt{\frac{\sum_{i=1}^n (X_i - \bar{X})^2}{n-1}}$$

"T" factor is obtained from table of Grubb's rejection criteria.

6. TEST RESULTS

The results submitted by the participating laboratories were compiled and evaluated following the procedures described above.

Results for Sample SC-01 are listed in Tables 4, 5, 6, and 7 which show, respectively, the ambient and engine operating conditions, general properties of sample, deviation of general properties and calculations (see p. 16 through 22).

Results for Sample SC-02 are similarly listed in Tables 8, 9, 10, and 11. Similarly, the results for Sample SC-03 are shown in Tables 12, 13, 14, and 15 (see p. 23 through 36).

These results are summarized visually in Figures 1, 2, and 3 which plot the laboratory test results, the average octane number, standard deviations, and critical rejection of outliers for Samples SC-01, SC-02, and SC-03, respectively (see p. 37 through 39).

7. CONCLUSION

From the results of the tests conducted by all participating laboratories, and the evaluation of standard deviation/rejection of outliers (see Fig. 1, Fig. 2, and Fig. 3), the following conclusions can be drawn.

7.1 Test Results

Concerning sample SC-01, 4 (four) test results exceed standard deviation viz, the test results coming from LC-05, LC-07, LC-9 and LC-12, which are however not be rejected as outliers being still within the permitted limits. Hence, all the list results from all the participating laboratories concerning sample SC-01 are satisfactory.

Concerning sample SC-02, only 1 (one) test results viz coming from LC-04 exceeds standard deviation, which however is still within the permitted limits and is not to be rejected as outlier. Hence also concerning sample SC-02 all the test results are satisfactory.

Concerning sample SC-03, five test results viz coming from LC-02, LC-04, LC-06, LC-09 and LC-12 exceed standard deviation, but none exceeding the permitted limits, they are all not to be rejected as outliers. This means that all the test results of sample SC-03 are satisfactory.

The above test result also agree with the test of the general properties of each sample as shown in the Table "General Properties of Sample", where it is shown that there are no significant deviations concerning the test results of Specific Gravity, RVP and Distillation.

7.2 Adherence to Test Procedure

Although, the test results of all the sample SC-01, SC-02, and SC-03 submitted by all the participating laboratories are satisfactory (none is rejected as outliers), from the data on ambient and engine operating conditions of sample, concerning SC-01, SC-02 and SC-03, however, it can be seen that some of the participating laboratories have not satisfied the conditions for the correlation of CFR engines. Some have even deviated from the test procedure established by the ASTM.

Examples of non-adherence to procedure are as follows:

(1) Concerning sample SC-01

- Participant laboratory LC-02 carried out the test with intake air temperature at 115°F. According to Table 4 "ASTM Manual", at barometric pressure 766,2 Hg (30,16 in Hg) LC-02 should have carried out the test with intake air temperature at 128°F. Moreover the knock sensitivity (the difference pointed out by LC-02 during the test was 52). This is too large and can cause inaccuracies in acquiring the O.N. by interpolation. According to the "ASTM Manual" for octane numbers lower than 100 the knock sensitivity has to be about 30 or less.
- Participant laboratory LC-09 carried out the test with intake air temperature at 85°F. According to Table 4 of the ASTM Manual, at barometric pressure 760 mm Hg (=29,92 in Hg), LC-09 should have carried out the test with intake air temperature at 125°F. Moreover, LC-09 used the C.R Method in carrying out the test, while according to the conditions agreed for conducting the CFR Engine Correlation, the method used should be the Bracketing Method.
- Participant laboratory LC-13 carried out the test with a too large knock sensitivity i.e. 58. The proper knock sensitivity taken should have been about 30.

(2) Concerning sample SC-02

- Participant laboratory LC-02 (as in the testing of sample SC-01) carried out the test with intake air temperature 128°F.
- Participant laboratory LC-09 (as in the testing of sample SC-01) carried out the test with intake air temperature at 85°F, which should have been carried out at 125°F. The method used should have been the Bracketing Method, and not the C.R. Method.

(3) Concerning sample SC-03

- Participant laboratory LC-02 (as in the testing of SC-01 and SC-02) carried out the test with intake air temperature at 115°F, which should have been carried out at 128°F.
- Participant laboratory LC-09 (as in the testing of sample SC-07 and SC-02) carried out the test with intake air temperature at 85°F, which should have been carried out at 125°F. Also the method used should have been the Bracketing Method and not the C.R. Method.

LC-13	CFR-48	97.4	0.0	0.0
	SUM	1168.6	3.6	1.9
	No. of results (n)	12	12	12

Step 1 :

$$\text{Average Octane Number : } \frac{\text{sum of results}}{\text{no. of result}} = \frac{1168.6}{12} = 97.38 = 97.4$$

Step 2 :

$$\text{Average Deviation : } \frac{\text{sum of deviation}}{\text{no. of deviation}} = \frac{3.6}{12} = 0.3$$

Step 3 :

$$\text{Variance : } \frac{\text{sum of dev. Squared}}{(\text{no. of dev. squared}-1)} = \frac{1.9}{12-1} = \frac{1.9}{11} = 0.17$$

$$\text{Step 4 : Standard Deviation : square root of variance} = \sqrt{\text{variance}} = \sqrt{0.17} = 0.41$$

Step 5 :

$$\text{Rejection of Outliers : "T" factor} \times \text{std. deviation} = 2.55 \times 0.41 = 1.05$$

All results are not rejected.

	SUM	1046.1	3.3	1.75
	No. of results (n)	12	12	12

Step 1 :

$$\text{Average Octane Number} : \frac{\text{sum of results}}{\text{no. of results}} = \frac{1046.1}{12} = 87.18 = 87.2$$

Step 2 :

$$\text{Average Deviation} : \frac{\text{sum of deviation}}{\text{no. of deviation}} = \frac{3.3}{12} = 0.28$$

Step 3 :

$$\text{Variance} : \frac{\text{sum of dev. squared}}{(\text{no. of dev. squared} - 1)} = \frac{1.75}{12-1} = \frac{1.75}{11} = 0.16$$

Step 4 :

$$\text{Standard Deviation} : \text{squared root of variance} = \sqrt{\text{variance}} = \sqrt{0.16} = 0.40$$

Step 5 :

$$\text{Rejection of Outliers} : "T" \text{ factor} \times \text{std. deviation} = 2.55 \times 0.40 = 1.02$$

All results are not rejected.
